

# AFFINE GROUP SCHEMES AND HOPF ALGEBRAS

SACHIN GAUTAM

ABSTRACT. The aim of these notes is to prove the equivalence between category of affine group schemes over algebraically closed field  $k$  and category of commutative, co-commutative Hopf algebras over  $k$ . We will explain in detail the notations and terminology, before giving proof of this theorem. Reader is assumed to know basic algebra.

## 1. BASIC NOTIONS

### 1.1. Categories and Functors.

**Definition 1.** A category  $\mathcal{C}$  is a class  $Obj(\mathcal{C})$ , called objects of the category and for every  $X, Y \in Obj(\mathcal{C})$ , a set  $Hom_{\mathcal{C}}(X, Y)$ , called set of morphisms from  $X$  to  $Y$  and a map (called composition) for every  $A, B, C \in Obj(\mathcal{C})$ :

$$Hom(A, B) \times Hom(B, C) \rightarrow Hom(A, C)$$

such that the following conditions are satisfied:

- (C1) For  $A, B, A', B' \in Obj(\mathcal{C})$ , such that  $(A, B) \neq (A', B')$ , the sets  $Hom(A, B)$  and  $Hom(A', B')$  are disjoint.
- (C2) There exists an element  $1_A \in Hom(A, A)$  for every  $A \in Obj(\mathcal{C})$ , which acts as identity with respect to composition, i.e, for every  $u \in Hom(A, B)$  (resp.  $v \in Hom(B, A)$ ),  $1_A u = u$  (resp.  $v 1_A = v$ ), where  $B \in Obj(\mathcal{C})$ .
- (C3) Composition is associative. That is for any  $A, B, C, D \in Obj(\mathcal{C})$  and  $u \in Hom(A, B)$ ,  $v \in Hom(B, C)$  and  $w \in Hom(C, D)$ , we have

$$w(vu) = (wv)u$$

We also have a notion of opposite category to a category  $\mathcal{C}$ , which is denoted by  $\mathcal{C}^{op}$ . This category has same objects as  $\mathcal{C}$  and morphisms

$$Hom_{\mathcal{C}^{op}}(A, B) = Hom_{\mathcal{C}}(B, A)$$

and

$$Hom_{\mathcal{C}^{op}}(A, B) \times Hom_{\mathcal{C}^{op}}(B, C) \rightarrow Hom_{\mathcal{C}^{op}}(A, C)$$

is obtained by composition

$$Hom_{\mathcal{C}}(C, B) \times Hom_{\mathcal{C}}(B, A) \rightarrow Hom_{\mathcal{C}}(C, A)$$

**Definition 2.** Let  $\mathcal{C}$  and  $\mathcal{D}$  be two categories. By a (covariant) *functor*  $F$  between  $\mathcal{C}$  and  $\mathcal{D}$ , we understand a map  $F : \mathcal{C} \rightarrow \mathcal{D}$ , which to each object  $A \in \mathcal{C}$ , associates an object  $F(A) \in \mathcal{D}$  and to each morphism  $f \in Hom_{\mathcal{C}}(A, B)$ , associates a morphism  $F(f) \in Hom_{\mathcal{D}}(F(A), F(B))$ , such that following axioms are satisfied:

$$(F1) \quad F(1_A) = 1_{F(A)}, \text{ for any } A \in \mathcal{C}.$$

$$(F2) \quad F(uv) = F(u)F(v), \text{ where } v \in Hom_{\mathcal{C}}(A, B) \text{ and } u \in Hom_{\mathcal{C}}(B, C)$$

Similarly, one can define contravariant functor by reversing arrows. More explicitly, for  $f \in Hom_{\mathcal{C}}(A, B)$ , we obtain  $F(f) \in Hom_{\mathcal{D}}(F(B), F(A))$ . Second axiom is thus changed accordingly. Note that a contravariant functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  is same as a covariant functor  $F : \mathcal{C}^{op} \rightarrow \mathcal{D}$ .

**Definition 3.** Let  $X, Y \in Ob(\mathcal{C})$  and assume that  $X \rightarrow Z$  and  $Y \rightarrow Z$  are two morphisms in  $\mathcal{C}$ . The *fibre product* of  $X$  and  $Y$  over  $Z$ , denoted by  $X \times_Z Y$ , is defined to be an object in  $\mathcal{C}$ , together with morphisms  $X \times_Z Y \rightarrow X$  and  $X \times_Z Y \rightarrow Y$ , such that following diagram is commutative:

$$\begin{array}{ccc} X \times_Z Y & \longrightarrow & X \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Z \end{array}$$

Moreover, if there is another such object, say  $Z'$  and morphisms  $Z' \rightarrow X$  and  $Z' \rightarrow Y$ , then there is a unique map  $X \times_Z Y \rightarrow Z'$  such that the following diagram commutes:

$$\begin{array}{ccc} X \times_Z Y & \longrightarrow & X \\ \downarrow & \searrow & \downarrow \\ & Z' & \\ \downarrow & \swarrow & \downarrow \\ Y & \longrightarrow & Z \end{array}$$

## 1.2. Presheaves and sheaves.

### 1.3. Local ringed spaces.

**Definition 4.** A *ringed space* is a topological space  $X$  together with sheaf of rings  $\mathcal{O}_X$ , called *structure sheaf* of  $X$ . We say  $(X, \mathcal{O}_X)$  is *local ringed space*, if for every  $x \in X$ , the ring of stalks over  $x$ ,  $\mathcal{O}_{X,x}$  is a local ring. We denote by  $\mathfrak{m}_x$ , the unique maximal ideal of  $\mathcal{O}_{X,x}$ .

In order to make sense of category of local ringed spaces, we need to define the notion of morphism between ringed spaces.

**Definition 5.** Let  $(X, \mathcal{O}_X)$  and  $(Y, \mathcal{O}_Y)$  be two local ringed spaces. By a morphism between  $X$  and  $Y$ , we mean a continuous map (of topological spaces)  $f : X \rightarrow Y$ , together with morphism of sheaves  $F : \mathcal{O}_Y \rightarrow f_*(\mathcal{O}_X)$ .

## 2. AFFINE SCHEMES

Let  $A$  be a commutative ring with unity. We begin by associating a local ringed space to  $A$ , as follows:

- (1) As topological space  $Spec(A)$  is collection of all prime ideals of  $A$ , with closed sets of the form

$$V(\mathfrak{a}) = \{\mathfrak{p} \mid \mathfrak{a} \subset \mathfrak{p} \text{ and } \mathfrak{p} \text{ is prime ideal of } A\}$$

where  $\mathfrak{a}$  is any ideal of  $A$ . Note that for any ideal  $\mathfrak{a}$  of  $A$ , the corresponding closed set  $V(\mathfrak{a})$  is just  $Spec(A/\mathfrak{a})$  and for any  $f \in A$ , the corresponding open set  $Spec(A) \setminus V(f)$ , denoted by  $D(f)$ , is just  $Spec(A_f)$ . Such open sets form basis for the above topology on  $Spec(A)$  and are usually called *distinguished* open sets or *principal* open sets.

- (2) The structure sheaf  $\mathcal{O}_{Spec(A)}$  is defined as (on distinguished open sets):

$$\mathcal{O}_{Spec(A)}(D_f) := A_f, \text{ for every } f \in A$$

For any  $\mathfrak{p} \in Spec(A)$ , the stalk  $\mathcal{O}_{Spec(A), \mathfrak{p}}$  is just  $A_{\mathfrak{p}}$ , localization of  $A$  at prime  $\mathfrak{p}$  and hence  $(Spec(A), \mathcal{O}_{Spec(A)})$  is local ringed space.

**Definition 6.** Let  $A$  and  $B$  be two commutative rings with unity and let  $f : A \rightarrow B$  be unital homomorphism of rings. We can define  ${}^a f : Spec(B) \rightarrow Spec(A)$  by

$$f^*(\mathfrak{q}) = f^{-1}(\mathfrak{q})$$

which can be checked easily to be continuous map of topological spaces. Moreover, the morphism of sheaves  $\tilde{f} : \mathcal{O}_{Spec(A)} \rightarrow {}^a f_* \mathcal{O}_{Spec(B)}$  is given by

$$\begin{array}{ccc} \mathcal{O}_{Spec(A)}(D(h)) & \longrightarrow & \mathcal{O}_{Spec(B)}(D(h')) \\ \parallel & & \parallel \\ A_h & \longrightarrow & B_{h'} \end{array}$$

where  $h' = f(h)$  for any  $h \in A$ .

Thus we have defined  $Spec$  as a *contravariant functor* from category of commutative rings to category of local ringed spaces.

**Definition 7.** Let  $(X, \mathcal{O}_X)$  be a local ringed space. We say  $X$  is *affine scheme*, if there exists a commutative ring with unity,  $A$  such that there is following isomorphism of local ringed spaces.

$$(X, \mathcal{O}_X) \cong (Spec(A), \mathcal{O}_{Spec(A)})$$

Note that a map between affine schemes is morphism if and only if it corresponds to ring homomorphism of corresponding rings. That is,  $Spec$  defined following equivalence of categories:

$$\{\text{commutative rings with unity}\} \leftrightarrow \{\text{affine schemes}\}$$

### 3. AFFINE SCHEMES OVER $k$

Let  $k$  be algebraically closed field.

#### 3.1. Category of affine schemes over $k$ .

**Definition 8.** Let  $A$  be vector space over  $k$ . We say  $A$  is a *unital  $k$ -algebra* if there are  $k$  linear maps  $\mu : A \otimes_k A \rightarrow A$  and  $\eta : k \rightarrow A$ , such that the following diagrams are commutative:

$$\begin{array}{ccc} A \otimes A \otimes A & \xrightarrow{\mu \otimes Id_A} & A \otimes A \\ \downarrow Id_A \otimes \mu & & \downarrow \mu \\ A \otimes A & \xrightarrow{\mu} & A \end{array}$$
  

$$\begin{array}{ccccc} k \otimes A & \longleftarrow & A & \longrightarrow & A \otimes k \\ \downarrow \eta \otimes Id_A & & \parallel & & \downarrow Id_A \otimes k \\ A \otimes A & \xrightarrow{\mu} & A & \xleftarrow{\mu} & A \otimes A \end{array}$$

Moreover, we say  $A$  is commutative if the following diagram is commutative:

$$\begin{array}{ccc} A \otimes A & \xrightarrow{\tau} & A \otimes A \\ & \searrow \mu & \swarrow \mu \\ & & A \end{array}$$

where  $\tau$  is *flip map* ( $\tau(a \otimes b) = b \otimes a$ ).

From now on, we will assume all  $k$ -algebras to be unital.

**Definition 9.** Let  $(Spec(A), \mathcal{O}_{Spec(A)})$  be an affine scheme. We say it is affine scheme over  $k$  if  $A$  is finitely generated commutative  $k$ -algebra. We will often abuse notation and write  $Spec(A)$  for corresponding affine scheme over  $k$ .

Note that by the way of construction we have the following equivalence of categories (or more precisely, anti-equivalence, since  $Spec$  is contravariant).

$$\{\text{Finitely generated commutative } k\text{-algebras}\}^{op} \leftrightarrow \{\text{Affine schemes over } k\}$$

We denote the category of affine schemes over  $k$  by  $\mathbf{AffSch}_k$  and the category of finitely generated commutative  $k$ -algebras by  $\mathbf{FGAlg}_k$ .

**3.2. Fibre products in category  $\text{AffSch}_k$ .** In this section, our primary tool is the fact that  $\text{Spec}$  is a contravariant functor. We will explore the technique of *arrow reversal* that will be extremely useful in understanding language of coalgebras, bialgebras and Hopf algebras later.

Let  $A$  and  $B$  be finitely generated unital commutative  $k$ -algebras. We have the following natural maps (see Definition 8)

$$\begin{array}{ccc}
 & A \otimes A \rightarrow A & \\
 & k \rightarrow A & \\
 A & \xrightarrow{\quad} & A \otimes B \\
 \uparrow & & \uparrow \\
 k & \xrightarrow{\quad} & B
 \end{array}$$

By applying  $\text{Spec}$  to last diagram, we get the following commutative diagram of affine schemes:

$$\begin{array}{ccc}
 \text{Spec}(A) & \longleftarrow & \text{Spec}(A \otimes B) \\
 \downarrow & & \downarrow \\
 \text{Spec}(k) & \longleftarrow & B
 \end{array}$$

which allows us to identify (see Definition 3).

$$(1) \quad \text{Spec}(A \otimes B) = \text{Spec}(A) \times_{\text{Spec}(k)} \text{Spec}(B)$$

Moreover, we get the following natural morphisms of affine schemes:

$$(2) \quad \text{Spec}(A) \longrightarrow \text{Spec}(A) \times \text{Spec}(A)$$

$$(3) \quad \text{Spec}(A) \longrightarrow \text{Spec}(k)$$

The morphism (2) is called *diagonal map* and (3) is called *structural morphism*. For most of the times, we will use these morphisms without explicit mention. Moreover, since for any  $k$ -algebra,  $A$ ,  $k \otimes A$  and  $A \otimes k$  are canonically isomorphic to  $A$  (via scalar multiplication), we get the following canonical isomorphism

$$\text{Spec}(A) \cong \text{Spec}(k) \times \text{Spec}(A) \cong \text{Spec}(A) \times \text{Spec}(k)$$

#### 4. AFFINE GROUP SCHEMES

**Definition 10.** Let  $G$  be an affine scheme over  $k$ . We say  $G$  is *affine group scheme* over  $k$ , if there are morphisms  $\mu : G \times G \rightarrow G$ ,  $\gamma : G \rightarrow G$  and  $\varepsilon : \text{Spec}(k) \rightarrow G$ ,

such that the following diagrams are commutative:

$$(4) \quad \begin{array}{ccc} \text{[Associativity]} & G \times G \times G & \xrightarrow{1_G \times \mu} & G \times G \\ & \downarrow \mu \times 1_G & & \downarrow \mu \\ & G \times G & \xrightarrow{\mu} & G \end{array}$$

$$(5) \quad \begin{array}{ccccc} \text{[Unit]} & & \text{Spec}(k) \times G & & \\ & & \downarrow \varepsilon \times 1_G & & \\ & G & & G \times G & \\ & \uparrow 1_G & & \downarrow \mu & \\ & G \times \text{Spec}(k) & \xrightarrow{1_G \times \varepsilon} & G \times G & \\ & \downarrow 1_G & & \downarrow \mu & \\ & G & & G & \end{array}$$

$$(6) \quad \begin{array}{ccccc} \text{[Inverse]} & G & \xrightarrow{\quad} & G \times G & \\ & \downarrow & & \downarrow 1_G \times \gamma & \downarrow \gamma \times 1_G \\ & \text{Spec}(k) & & G \times G & G \times G \\ & \downarrow \varepsilon & & \downarrow \mu & \downarrow \mu \\ & G & \xrightarrow{\quad} & G & \end{array}$$

**Theorem 1.** *Let  $G$  be affine group scheme over  $k$ . Then for every  $X \in \mathbf{AffSch}_k$ ,  $\text{Hom}(X, G)$  is a group under the multiplication (of  $f, g \in \text{Hom}(X, G)$ ) defined by commutativity of following diagram:*

$$\begin{array}{ccc} X & \longrightarrow & X \times X \\ \downarrow f \cdot g & & \downarrow f \times g \\ G & \xleftarrow{\mu} & G \times G \end{array}$$

and corresponding to each  $X \rightarrow Y$ , morphism of affine schemes over  $k$ , the induced map

$$\text{Hom}(Y, G) \rightarrow \text{Hom}(X, G)$$

is homomorphism of groups. In other words, we have a contravariant functor  $\text{Hom}(-, G) : \mathbf{AffSch}_k \rightarrow \text{Groups}$ .

Moreover, the above property characterizes affine group schemes over  $k$ . That is,

an affine scheme over  $k$ , say  $G$  is affine group scheme over  $k$  if and only if the functor  $\text{Hom}(-, G)$  takes values in category of groups.

We denote by  $\mathbf{AffGpSch}_k$ , category of affine group schemes over  $k$ .

4.1. General group objects.

**Definition 11.** Let  $\mathcal{C}$  be a category. Let  $X \in \mathcal{C}$ . We say  $X$  is a *group object* in  $\mathcal{C}$  if  $\text{Hom}(-, X)$  defines a contravariant functor from  $\mathcal{C}$  to category of groups.

5. HOPF ALGEBRAS

**Definition 12.** Let  $C$  be a  $k$ -vector space. We say that  $C$  is a *coalgebra* over  $k$  if there are  $k$ -linear maps  $\Delta : C \rightarrow C \otimes C$  and  $\varepsilon : C \rightarrow k$  such that the following diagrams are commutative:

$$\begin{array}{ccc}
 C & \xrightarrow{\Delta} & C \otimes C \\
 \Delta \downarrow & & \downarrow 1_C \times \Delta \\
 C \otimes C & \xrightarrow{\Delta \otimes 1_C} & C \otimes C \otimes C \\
 \\ 
 k \otimes C & \xlongequal{\quad} & C & \xlongequal{\quad} & C \otimes k \\
 \varepsilon \otimes 1_C \uparrow & & \parallel & & \uparrow 1_C \otimes \varepsilon \\
 C \otimes C & \xleftarrow{\Delta} & C & \xrightarrow{\Delta} & C \otimes C
 \end{array}$$

Moreover, we say that  $C$  is *co-commutative* if the following diagram commutes:

$$\begin{array}{ccc}
 & C & \\
 \Delta \swarrow & & \searrow \Delta \\
 C \otimes C & \xrightarrow{\tau} & C \otimes C
 \end{array}$$

If  $C$  and  $D$  are two coalgebras over  $k$ , a  $k$ -linear map  $f : C \rightarrow D$  is said to be coalgebra map if the following diagrams commute:

$$\begin{array}{ccc}
 C & \xrightarrow{\Delta_C} & C \otimes C \\
 f \downarrow & & \downarrow f \otimes f \\
 D & \xrightarrow{\Delta} & D \otimes D
 \end{array}$$

$$\begin{array}{ccc}
 C & & k \\
 f \downarrow & \searrow \varepsilon_C & \\
 D & & \nearrow \varepsilon_D
 \end{array}$$

Now let  $A$  be a  $k$ -algebra and  $C$  be a  $k$ -coalgebra. Then  $\text{Hom}_k(C, A)$  has canonical structure of  $k$ -vector space. We define a product on it, making it a unital  $k$ -algebra. For any two  $f, g \in \text{Hom}(C, A)$ , define *convolution product*  $f * g$  by commutativity of following diagram:

$$\begin{array}{ccc} C & \xrightarrow{\Delta} & C \otimes C \\ f * g \downarrow & & \downarrow f \otimes g \\ A & \xleftarrow{\mu} & A \otimes A \end{array}$$

It is easy to check that the composition  $C \rightarrow k \rightarrow A$  (namely  $\eta\varepsilon$ ) is unit with respect to convolution product.

**Definition 13.** A *bialgebra* over  $k$  is tuple  $(B, \mu, \eta, \Delta, \varepsilon)$  such that

- (1)  $(B, \mu, \eta)$  is  $k$ -algebra.
- (2)  $(B, \Delta, \varepsilon)$  is  $k$ -coalgebra.
- (3) The following diagram commutes:

$$\begin{array}{ccccc} & & H & & \\ & \mu \nearrow & & \searrow \Delta & \\ H \otimes H & & & & H \otimes H \\ \Delta \otimes \Delta \downarrow & & & & \uparrow \mu \otimes \mu \\ H \otimes H \otimes H \otimes H & \xrightarrow{S_{(23)}} & & & H \otimes H \otimes H \otimes H \end{array}$$

which means that  $\Delta$  is algebra map (or  $\mu$  is coalgebra map).

**Definition 14.** Let  $(H, \mu, \eta, \Delta, \varepsilon)$  be a bialgebra. If there exists a  $k$ -linear map  $S \in \text{Hom}(H, H)$ , such that  $S * 1_H = 1_H * S = \eta\varepsilon$ , that is,

$$\begin{array}{ccccc} H \otimes H & \xleftarrow{\Delta} & H & \xrightarrow{\Delta} & H \otimes H \\ \downarrow S \otimes 1_H & & \downarrow \varepsilon & & \downarrow 1_H \otimes S \\ & & k & & \\ \downarrow \eta & & \downarrow \eta & & \\ H \otimes H & \xrightarrow{\mu} & H & \xleftarrow{\mu} & H \otimes H \end{array}$$

then  $H$  is called Hopf algebra and  $S$  is called antipodal map.

A morphism between Hopf algebras is both algebra and coalgebra morphism, which commutes with antipodal map. Let  $\mathfrak{H}$  denote the category of commutative, co-commutative Hopf algebras over  $k$  (which are finitely generated over  $k$ ).

## 6. MAIN THEOREM

**Theorem 2.** *There is an anti-equivalence of categories between category of affine group schemes over  $k$ ,  $\mathbf{AffGpSch}_k$  and category of commutative, co-commutative*

Hopf algebras over  $k$ ,  $\mathfrak{H}$ . This equivalence is given by following functors, quasi-inverse to each other:

$$\begin{aligned} \mathbf{AffGpSch}_k &\longrightarrow \mathfrak{H} \\ (\mathrm{Spec}(A), \mathcal{O}_{\mathrm{Spec}(A)}) &\longmapsto \mathcal{O}_{\mathrm{Spec}(A)}(\mathrm{Spec}(A)) = A \\ \mathfrak{H} &\longrightarrow \mathbf{AffGpSch}_k \\ H &\longmapsto (\mathrm{Spec}(H), \mathcal{O}_{\mathrm{Spec}(H)}) \end{aligned}$$
